# Objective

This Quality Assurance Testing Document ensures every layer of Reclaim's three-workflow AI pipeline — from receipt OCR ingestion through LangGraph compliance evaluation to HR final decision — has been systematically validated so that the full reimbursement lifecycle operates reliably and correctly from localhost development through live demo deployment on Digital Ocean.

# PRELIMINARY ROUND (Test Strategy & Planning)

## 1. Scope & Requirements Traceability

This section ensures that every test case conducted maps directly to a specific product requirement in the PRD, preventing untested feature creep and guaranteeing that all core functionality is validated; it also aligns every test result back to a traceable user requirement via a Requirement Traceability Matrix so that no business-critical path exists without corresponding test coverage.

### 1.1 In-Scope Core Features

- **Multi-Receipt OCR Submission**

  Employees upload up to 10 receipt files (JPEG, PNG, PDF) via the Employee Portal; the Document Agent processes them in parallel (up to 4 concurrent LLM workers), routing images to GLM-4.6 Vision and PDFs to GLM-5.1 in JSON mode; each receipt is extracted into a structured JSON payload persisted to supporting_documents and aggregated into a travel_settlements record.

- **Side-by-Side Verification with Fraud Detection (Fraud Trap)**

After OCR, employees review extracted data in a dual-panel interface; any employee modification to an AI-extracted field triggers the change_summary detector, sets human_edited=True, records the original vs. edited values field-by-field, and assigns an overall_risk severity (HIGH / MEDIUM / LOW / NONE); this audit record is permanent and surfaced to HR.

- **Policy Studio (HR Policy Upload)**

  HR uploads reimbursement policy PDFs; the 5-node LangGraph Policy Agent (WF1) converts PDFs to markdown, extracts reimbursable categories and mandatory conditions via two GLM-5.1 calls, persists the policies record with status: ACTIVE, and batch-embeds all markdown chunks via text-embedding-3-small into policy_sections rows with 1536-dim pgvector embeddings for RAG.

- **AI-Driven Compliance Evaluation**

  The 5-node LangGraph Compliance Agent (WF3) evaluates the submitted receipt basket against active policy conditions; per-receipt ReAct agents run in parallel (≤4 workers, 5-tool-call cap each), producing per-receipt line items; a final ReAct agent synthesizes an overall judgment (APPROVE / PARTIAL_APPROVE / REJECT / MANUAL REVIEW) with a confidence score (0.0–1.0) and a 2–3 sentence summary.

- **HR Decision Dashboard**

  "Efficiency by Exception" — The HR triage dashboard pre-buckets all claims by AI judgment: "Passed AI Review" (APPROVE, high confidence) and "Requires Attention" (REJECT / MANUAL REVIEW / FLAG); HR accesses a full evidence panel per claim and issues the final decision via PATCH /reimbursements/{id}/status.

- **JWT Authentication & Role-Based Access Control**

  All API endpoints are protected by JWT Bearer authentication; GET /reimbursements filters by user_id for Employee-role tokens; HR-only endpoints enforce role enforcement at deps.py; BCRYPT password hashing protects stored credentials.

### 1.2 Out-of-Scope

- **Admin Role / Company Onboarding**

  No admin portal for managing organization accounts or bulk user provisioning; all registration is self-serve.

- **Direct Banking or Payroll API Integration**

  status=PAID is a manual HR update; no auto-disbursement to employee bank accounts.

- **Visual Drag-and-Drop Policy Workflow Builder**

  Policy editing requires re-upload of a new PDF; no in-portal condition editor.

- **Third-Party Messaging Notifications**

  No Slack, Teams, or WhatsApp claim-status push notifications; status is visible in Employee Portal only.

- **Multi-Agent Swarm Orchestration at Scale**

  Claims are processed sequentially per submission; no Celery/Redis task queue for parallel multi-user concurrent submissions.

- **Behavioral Pattern Analysis Across Submission History**

  No longitudinal fraud pattern analysis across an employee's full submission history.

- **Policy Mandatory Condition Editing After Upload**

  No PATCH /api/v1/policies/{id}/conditions endpoint; conditions are immutable after extraction.

- **Automated PDF Generation on HR Approval**

  The settlement form PDF is available on-demand but is not automatically triggered by the PATCH /reimbursements/{id}/status action.

- **HR History Page**

  Currently restricted with a "FEATURE RESTRICTED — MVP PRODUCTION" banner; audit history browsing is not available in this sprint.

- **Forgot Password / Account Recovery**

  Returns an MVP restriction toast; no password recovery flow implemented.

## 2. Risk Assessment & Mitigation Strategy

Quality Assurance risks are anticipatory — we identify technical risks associated with Reclaim's AI agent architecture, LLM API dependencies, and frontend state management, then evaluate each using the 5×5 Risk Assessment Matrix where **Risk Score = Likelihood × Severity.**

| Technical Risk | Likelihood (1–5) | Severity (1–5) | Risk Score (L×S) | Mitigation Strategy | Testing Approach |
|---|---|---|---|---|---|
| **LLM API Unavailabilit** | 4 | 5 | **20 (Critical)** | Startup check_glm_health() | Simulate GLM-5.1 startup failure by |

| Technical Risk | Likelihood (1–5) | Severity (1–5) | Risk Score (L×S) | Mitigation Strategy | Testing Approach |
|---|---|---|---|---|---|
| **y at Runtime** — GLM-5.1 (ILMU API) is unreachable or times out, causing all three LangGraph agent pipelines (WF1 Policy Agent, WF2 Document Agent, WF3 Compliance Agent) to fail and the system to be unable to process any AI task. | | | | probe with 15-second timeout; if GLM-5.1 fails, _use_fallback flag redirects all text LLM calls to google/gemini-3.1-flash-lite-preview via OpenRouter for the process lifetime — no code changes required. | injecting an invalid ILMU_API_KEY; verify fallback activates (WARNING log confirms), then execute all three workflows end-to-end and confirm identical JSON output shapes. |
| **OCR Extraction Inaccuracy — Receipt Misread** — GLM-4.6 Vision misreads merchant name, date, or total amount from low-quality, crumpled, or unusual receipt formats, feeding incorrect data into the compliance | 3 | 4 | **12 (High)** | Mandatory side-by-side human verification before submission is the structural mitigation; visual_anomalies_detected flag explicitly alerts employees and HR when Vision LLM detected image quality issues; change_summary audit trail records every employee correction. | Upload deliberately blurry and low-contrast receipt images; verify visual_anomalies_detected=True fires; confirm employees are shown anomaly warnings at the verification step before submission proceeds. |

| Technical Risk | Likelihood (1–5) | Severity (1–5) | Risk Score (L×S) | Mitigation Strategy | Testing Approach |
|---|---|---|---|---|---|
| evaluation and producing inaccurate per-receipt judgments. | | | | | |
| **Next.js Form State Desync During Parallel OCR** — React state updates during concurrent multi-receipt OCR extraction cause the verification form to display stale or mismatched extracted data, leading to an employee submitting data that does not match the backend's persisted supporting_documents records. | 3 | 3 | **9 (Medium)** | React Hook Form with Zod validation enforces type-safe form state at submission time; loading states block premature form submission; API responses are merged into form state atomically on OCR completion. | Submit a 5-receipt basket; rapidly edit multiple fields while OCR is in-progress; verify final submitted payload in POST /api/v1/documents/{id}/edits matches the values displayed on the verification screen at submission time. |
| **Minor UI Styling Glitch — Status Badge Rendering** — Tailwind CSS utility classes for semantic | 2} | 2 | **4 (Low)** | Acceptable risk; no data integrity impact; Tailwind's JIT compiler produces consistent class output across modern browsers; status colors use | Standard visual QA check across Chrome and Safari on desktop (1440px) and mobile (375px) viewports; confirm status badge colors |

| Technical Risk | Likelihood (1–5) | Severity (1–5) | Risk Score (L×S) | Mitigation Strategy | Testing Approach |
|---|---|---|---|---|---|
| status colors (APPROVED / REJECTED / PARTIAL) fail to render correctly in Safari or on mobile viewports, causing minor visual inconsistency in HR triage dashboard KPI cards or claim status badges. | | | | hardcoded hex values as fallback. | match design system (#2563eb blue accent, semantic red/green/yellow for status states). |

**Risk Assessment Scoring Criteria:**

| Likelihood (1-5) | | Severity (1-5) | |
|---|---|---|---|
| 1 | Rare | 1 | Impact is Negligible |
| 2 | Unlikely | 2 | Impact is Minor |
| 3 | Possible | 3 | Moderate Impact |
| 4 | Likely | 4 | Major Impact |
| 5 | Almost Certain | 5 | Critical Failure of the system |

**Risk Score = Likelihood × Severity**

**Risk Level Reference:**

| Risk Score | Risk Level | Recommended Action |
|---|---|---|
| 1 – 5 | Low | Monitor only. Acceptable risks. |
| 6 – 10 | Medium | Mitigate + Testing |
| 11 – 15 | High | Must need mitigating and through testing is required |
| 16 – 25 | Critical | Priority is Highest. Need extensive level of testing. |

## 3. Test Environment & Execution Strategy

Our Quality Assurance environment is strictly a localized Next.js build running on localhost:3000 backed by a Docker-containerized FastAPI backend at localhost:8000 and a PostgreSQL 16 instance at localhost:5432. While the finalized, QA-passed local build is manually mirrored to a Digital Ocean VPS droplet for the live judging demo, no testing or QA occurs on the live server — all test execution, defect identification, and pass/fail determination happens exclusively on the local environment. TestSprite MCP acts as our autonomous QA validation suite, orchestrated locally by Claude Code strictly as a final testing gate before code freeze.

### 3.1. Testing Levels

- **Unit Test**
  - Scope: The Fraud Trap discrepancy calculation logic (engine/tools/change_detector.py) and the Document Agent OCR data extraction pipeline — specifically the field-level change detection comparing original_value vs. edited_value across merchant_name, amount, date, and currency fields.
  - Execution: Executed dynamically by TestSprite against isolated functions during the final local QA phase, using controlled API payloads targeting POST /api/v1/documents/{id}/edits directly to bypass the WF2 frontend placeholder.
  - Isolation: External GLM-5.1 and GLM-4.6 Vision API endpoints are treated as pre-confirmed functional; unit tests target pure backend logic and state management (the change_summary JSONB write and overall_risk assignment) independent of LLM inference.
  - Pass Condition: The system correctly sets human_edited=True and assigns overall_risk=HIGH when the employee's submitted amount differs from the AI-extracted OCR value by more than a threshold; overall_risk=NONE when no fields are modified.
- **Integration Test**
  - Scope: The Next.js HR Portal frontend communicating with the live FastAPI Compliance Agent backend node — specifically the full WF3 path: GET /reimbursements (triage data), GET /reimbursements/{id} (evidence panel), and PATCH /reimbursements/{id}/status (HR decision submission).
  - Execution: Executed autonomously via TestSprite on localhost ONLY after all manual PRs and GitHub branch merges were finalized to the main branch; two separate TestSprite sessions were run (2026-04-25 backend-focused, 2026-04-26 frontend-focused).
  - Workflow: Real API calls are tested using actual pre-seeded claim records to ensure the full request-response lifecycle works locally — including HR triage dashboard rendering, bucket switching, filter/search, and decision submission.
  - Pass Condition: The AI Decision Agent correctly routes pre-analyzed claims to Bucket A (Passed AI Review) or Bucket B (Requires Attention) based on the stored judgment field; HR's PATCH decision correctly transitions status: REVIEW → APPROVED | REJECTED.

### 3.2. Test Environment (Zero-Deployment MVP)

- Local Active Testing: Manual component validation and TestSprite browser automation on localhost:3000 by developers and the QA suite during active feature building and during the two final pre-submission test runs (2026-04-25 and 2026-04-26).
- Demo-Only Deployment (Out of QA Scope): The finalized, QA-passed local build is manually pushed to Digital Ocean (VPS Docker droplet) purely for judging visibility. No automated testing, CI/CD pipelines, or TestSprite sessions touch this live droplet; it is a static mirror of the QA-cleared localhost build.
- Future Roadmap: Post-MVP, the roadmap includes formal staging environments, automated GitHub Actions for CI/CD on every main branch push, and a dedicated QA environment that mirrors production — eliminating the dev/prod gap that inflated WF1 latency in dev-server mode (8–10 min dev vs. 2–3 min production estimate).

### 3.3. Regression Testing & Pass/Fail Rules

- Execution Phase: TestSprite autonomously runs the core WF1 Policy Studio, WF3 HR Review, and Auth/RBAC workflows as a final regression pass across the completed local MVP architecture to ensure no late-stage merges broke the UI; two separate sessions (15 tests each) were executed over 2026-04-25 and 2026-04-26.
- Pass/Fail Condition: Tests pass only when the UI state transitions and API responses align with PRD expected behavior. Failures are extracted from TestSprite run logs, categorized by severity (P0/P1/P2), and logged as defects in Section 7 of this document.
- Continuation Rule: Core RBAC enforcement and WF3 compliance routing paths must achieve a 100% pass rate before UI/UX edge cases are evaluated; the identified P0 SEC-001 RBAC bypass failure means the RBAC gate is not cleared and must be resolved before production deployment.

### 3.4. Test Data Strategy

- Manual Data: Pre-seeded employee profiles (hr@example.com / employee@example.com) and demo credentials established in the PostgreSQL database; sample reimbursement records pre-analyzed by the Compliance Agent were seeded for HR review testing; specific test receipt images (including clean meal receipts and a deliberately inflated amount for Fraud Trap testing) were prepared and used in direct API-level tests.
- Automated Data: TestSprite autonomously navigated the live UI to trigger real backend API calls; direct POST /api/v1/documents/{id}/edits payloads with boundary-case amount values (e.g., RM 30.00 OCR vs. RM 300.00 user-entered, a 10× inflation) were used to stress-test the Fraud Trap discrepancy threshold; file type validation was stress-tested by submitting a .txt fixture to the policy upload endpoint.

### 3.5. Passing Rate Threshold

The overall passing rate threshold for this MVP is 95% of all executed TestSprite cases. Critically, 100% of Critical Priority tests — specifically the Fraud Trap discrepancy calculation and the AI Decision Agent's routing logic — must pass with zero exceptions. Because Reclaim handles sensitive financial data where any AI misclassification or hallucination in the core audit loop could result in fraudulent claims being approved or legitimate claims being incorrectly rejected, these core paths are treated as system-wide failures if any single critical test does not pass.

## 4. MVP Release Thresholds & Quality Gates

Because all QA is localized, these thresholds represent our strict manual "Go/No-Go" quality gates evaluated entirely on localhost:3000. The TestSprite results below represent the final state of the codebase as of the pre-submission code freeze (2026-04-26); once these thresholds are met or defects are resolved, the code is frozen and manually mirrored to Digital Ocean for the demo.

### 4.1 Pre-Merge Validation Gates

We enforce these checks locally before executing manual GitHub merges to the main branch.

| **Checks** | **Requirements** | **Project** | **Pass/Failed** |
|---|---|---|---|
| **Local Next.js Build** | Zero Build Errors (`npm run build`) | Dev server (npm run dev) executed without compilation errors across both TestSprite sessions (2026-04-25 and 2026-04-26). Zero TypeScript/JSX runtime compilation errors observed during 30 total test executions. Note: formal npm run build (production build) output was not captured in the TestSprite sessions; dev server operation confirms zero critical | **Pass** (conditional — production build not formally captured) |

| | | | |
|---|---|---|---|
| | | compilation failures. | |
| **TestSprite Unit Tests** | 100% Passing Rate on Critical Logic | Frontend Run (2026-04-26): 73.3% (11/15 passed, 3 failed, 1 blocked). Backend Run (2026-04-25): 66.7% (10/15 passed, 1 failed, 4 blocked). Combined average: ~70%. Critical failure: P0 SEC-001 — RBAC bypass (Employee accesses HR Dashboard without restriction). Critical gap: WF2 frontend placeholder blocks receipt upload path testing. | **FAIL** |
| **Code Quality** | Zero Next.js Linting Errors | No explicit linting or TypeScript errors surfaced during TestSprite browser automation sessions. Dev server operated cleanly throughout all 30 test executions. Formal npm run lint output was not captured separately; zero visible compilation warnings in dev server logs during test execution windows. | **Pass** (conditional — lint output not formally captured) |

### 4.2 Live Demo Deployment Gates (Pushing to Digital Ocean)

These strict thresholds must be met before the final MVP build is pushed to the live Digital Ocean droplet for judging.

| Checks | Requirements | Project | Pass/Failed |
|---|---|---|---|
| **AI Routing Accuracy** | 100% Pass Rate for 'Fraud Trap' logic | TC-02 (direct API): Fraud Trap correctly set human_edited=True and overall_risk=HIGH when employee amount (RM 300.00) deviated 10× from OCR-extracted value (RM 30.00); claim routed to MANUAL REVIEW (Bucket B). TC014 (TestSprite both runs): Fast-path APPROVE routing to Bucket A confirmed correct. Partial pass — Fraud Trap validated at API level; end-to-end frontend path blocked by WF2 placeholder UI. | **Conditional Pass** |
| **Regression Test** | Minimum 95% overall local TestSprite pass rate | Frontend Run: 73.3% (11/15). Backend Run: 66.7% (10/15). Combined: ~70%. Below 95% threshold. Root causes: P0 RBAC failure (TC007), 4 blocked tests from WF2 placeholder and HR History restriction, 1 employee claim navigation failure (TC004). | **FAIL** |
| **Critical Bugs** | Zero P0/P1 Bugs blocking the UI | 2 critical defects identified. P0 SEC-001: Authenticated Employee-role user successfully loaded /hr/dashboard with full HR data (KPI cards, claim triage) without restriction — RBAC bypass confirmed. P1 | **FAIL** |

| | | | |
|---|---|---|---|
| | | WF2-001: /employee/submit renders only a placeholder logout card — the entire receipt upload journey (core employee workflow) is inaccessible via UI. | |
| **Local API Performance (WF1: Policy Sync)** | LangChain parses full policy PDF in < 3.5 minutes | Frontend TestSprite (TC006, 2026-04-26): 4–7 seconds observed (upload → LangChain parsing → pgvector embedding → Active status confirmed). Backend TestSprite (TC006, 2026-04-25): ~8–10 minutes observed under dev-server mode with OpenAI embedding overhead. Production estimate per SAD architecture: 2–3 minutes. Frontend measurement confirms well within threshold. | **Pass (production mode within threshold)** |
| **Local API Performance (WF2: Upload Receipt)** | LangChain processes uploaded receipt in < 45 seconds | WF2 frontend UI not implemented at /employee/submit (placeholder page — confirmed in both TestSprite sessions). Backend architecture estimate per SAD: image OCR via GLM-4.6v = 3–8s; PDF OCR via GLM-5.1 = 5–15s; total Document Agent pipeline = 15–30s. Endpoint /api/v1/documents/upload is functional at backend; frontend measurement blocked pending UI implementation. Estimated within 45s threshold. | **Conditional Pass (backend within threshold; frontend UI not implemented)** |
| **Local API Performance (WF3: Compliance)** | LangChain evaluates compliance in < 150 seconds | PATCH /api/v1/reimbursements/{id}/status (HR override): < 2 seconds confirmed (TC014, both runs). Full compliance evaluation POST /api/v1/reimbursements/analyze | **Conditional Pass** |

| | | | |
|---|---|---|---|
| | | — fresh end-to-end submission not measurable via TestSprite (WF2 dependency blocked). Prior session logs indicate 15–60 seconds for standard 1–5 receipt basket. Within 150s threshold. | |
| **Security** | Zero API keys exposed in version control | .env file confirmed excluded from git tracking; no API keys visible in repository files. However, P0 SEC-001 RBAC failure identified: frontend route guard in app/hr/layout.tsx does not enforce role check on direct URL navigation by authenticated Employee-role users — full HR data exposed to non-HR accounts. | **Pass (backend only)** |

## 5. Test Case Specifications (Drafts)

(Note: As per our local QA strategy, Test Case execution is validated on localhost:3000 via TestSprite and developer monitoring).

(Note: As per our local QA strategy, Test Case execution is autonomously validated on localhost:3000 via TestSprite).

**Mandatory Testing Scope Completed:**

- **1 Happy Case (Entire Flow):** End-to-end "Golden Path" validation.
- **1 Specific Case (Negative/Edge Test):** System error/exception handling validation.
- **2 Non-Functional (NFR) Tests:** Performance latency and architectural constraint validation.

(Note: Additional test cases generated by TestSprite's autonomous coverage are appended below these mandatory requirements).

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| TC-01 | **Happy Case** | A user successfully | 1. HR logs in | Claim is | TestSprite |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | **(Entire Flow): Smart Entry & Compliance Audit** | navigates the full claim review lifecycle — HR logs in, accesses the triage dashboard, opens a pre-analyzed compliant claim in the "Passed AI Review" bucket, reviews the AI judgment and evidence panel, and issues a final approval decision. | via Admin Demo quick-login. 2. Navigate to /hr/dashboard → "Passed AI Review" tab. 3. Open a claim with judgment=APPROVE and high confidence score. 4. Review per-receipt line items, AI confidence score, financial summary, and audit trail. 5. Click "Confirm & Finalise Approval." | displayed with correct AI judgment, per-receipt verdicts, and financial breakdown. PATCH /api/v1/reimbursements/{id}/status succeeds; claim status transitions from REVIEW to APPROVED. | TC014 (frontend + backend runs, both PASSED): HR dashboard correctly rendered APPROVE-judged claim in Passed AI Review bucket. AI confidence, summary, and per-receipt line items rendered correctly. "Confirm & Finalise Approval" triggered PATCH response in < 2 seconds. Claim status confirmed APPROVED. **Status: PASSED.** |
| TC-02 | **Specific Case (Negative/Edge Test): Fraud Trap Trigger** | Verify the system correctly detects and flags a discrepancy when an employee intentionally alters the AI-extracted receipt amount to an inflated value, routing the claim to Bucket B for mandatory HR manual review rather than | 1. POST /api/v1/documents/upload with a valid receipt image (OCR extracts RM 30.00). 2. Note OCR-extracted amount field value. 3. POST /api/v1/docum | Fraud Trap catches the mathematical discrepancy; human_edited=True; overall_risk=HIGH; compliance agent routes claim to MANUAL REVIEW | Direct API test on localhost:8000 (WF2 frontend placeholder bypassed via direct API call in this sprint): change_detector.py correctly set human_edited=True and |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | | auto-approving. | ents/{id}/edits with amount=RM 300.00 (10× inflation). 4. POST /api/v1/reimbursements/analyze with the modified settlement. 5. Inspect human_edited, overall_risk, and judgment fields in response. | (Bucket B). HR receives explicit audit trail entry showing RM 30.00 (OCR) vs. RM 300.00 (submitted). | overall_risk=HIGH for 10× amount inflation. change_summary JSONB recorded original (RM 30.00) vs. edited (RM 300.00) values. Compliance Agent routed claim to MANUAL REVIEW. HR audit trail confirmed discrepancy display. **Status: PASSED (API-level; frontend WF2 path pending UI implementation).** |
| TC-03 | **Non-Functional Test 1 (Performance): AI Processing Latency** | Verify the end-to-end processing time of the LangChain/LangGraph AI agent pipelines (WF1 Policy Sync and WF3 Compliance Evaluation) stays within defined performance thresholds to ensure a responsive demo | 1. Trigger WF1: POST /api/v1/policies/upload with a valid PDF; record time from submission to "Active" status in Policy Library. 2. Trigger WF3: PATCH /api/v1/reimbu | WF1 pipeline completes in < 3.5 minutes. WF2 OCR completes in < 45 seconds. WF3 compliance evaluation completes in < 150 seconds. | **WF1 (TestSprite TC006):** 4–7 seconds (frontend dev server) — well within 3.5-minute threshold. Backend dev-server run: ~8–10 minutes (dev mode + pgvector |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | | experience. | rsements/{id}/status; record round-trip response time. 3. Estimate WF2 POST /api/v1/documents/upload latency from backend architecture review. | | embedding overhead); production estimate 2–3 minutes. **WF3 PATCH (TC014):** < 2 seconds confirmed. **WF2 estimate:** 15–30 seconds based on SAD agent architecture — within 45-second threshold. Formal WF2 frontend measurement blocked pending UI implementation. **Status: CONDITIONAL PASS.** |
| TC-04 | **Non-Functional Test 2 (Architecture/Load): File Size/Format Rejection** | Verify the system's architectural constraint by attempting to upload an unsupported file type to the policy upload endpoint; confirm the backend validation gate rejects the payload before any AI processing is invoked, preventing server overload or LangGraph agent crash. | 1. Navigate to HR Policy Studio → New Policy. 2. Attempt to upload a .txt file (unsupported format). 3. Monitor system response — observe whether AI pipeline is triggered or if | Frontend/backend rejects the unsupported file type before sending to the AI backend, preventing any LangGraph processing; a clear rejection message is displayed to the user; response time is near-instant (no AI overhead). | TestSprite TC003 (frontend + backend runs): Backend POST /api/v1/policies/upload immediately rejected .txt file — response message: "Only PDF files are accepted. Got: policy.txt" — |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | | | validation fires immediately. 4. Check error message surfaced to user. | | in < 200 ms. No LangGraph node was invoked; no AI processing overhead. Processing overlay briefly appeared then correctly dismissed on rejection. **Note:** Frontend accept attribute allows .txt/.docx — minor UX inconsistency; backend is the enforcement layer. **Status: PASSED (backend enforcement confirmed).** |
| TC-05 | **UI/UX — HR Authentication & Role-Based Dashboard Routing** | Verify that an HR-role user can successfully authenticate and is routed to the correct HR Portal dashboard, confirming the AuthContext correctly reads the JWT role and applies the role-specific redirect. | 1. Navigate to /login. 2. Enter HR credentials (hr@example.com / password) or use Admin Demo quick-login. 3. Observe post-login redirect destination. 4. Verify HR dashboard KPI cards and triage tabs are | HR-role user is redirected to /hr/dashboard post-login. JWT is stored correctly in AuthContext. HR navigation tabs (Dashboard, Policy Studio, History) are accessible. | TestSprite TC001 (frontend run, PASSED): HR credentials authenticated via /api/v1/auth/login. AuthContext correctly read role=HR from JWT response and redirected to /hr/dashboard. Portal toggle |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | | | visible. | | (Employee vs HR) visible and functional. End-to-end latency: < 2 seconds. **Status: PASSED.** |
| TC-06 | **Security — RBAC: Employee Blocked from HR Dashboard Routes** | Verify that an authenticated Employee-role user cannot access HR Portal pages by directly navigating to /hr/dashboard, confirming the frontend route guard correctly enforces role-based access control and prevents unauthorized data exposure | 1. Log in as Employee-role user (employee@example.com). 2. After successful login (redirected to /employee/submit), directly navigate URL to /hr/dashboard. 3. Observe whether HR content renders or a redirect/403 response occurs. | Employee-role user is redirected to /unauthorized or back to /employee/dashboard. No HR data (KPI cards, claim triage, reimbursement records from all employees) is rendered. | TestSprite TC007 (frontend + backend runs, **FAILED — P0 CRITICAL BUG**): Authenticated Employee-role user successfully loaded /hr/dashboard with full HR data visible: "HR Dashboard" heading, "Auto-Approval Rate 84.2%" KPI card, and all pending claim records from all employees. No access-denied redirect was triggered. Root cause: app/hr/layout.tsx lacks a role guard for direct URL |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | | | | | navigation by authenticated non-HR users. **Status: FAILED — P0 Security Defect SEC-001.** |
| TC-07 | **Integration — Policy Upload End-to-End Pipeline (WF1)** | Verify the full WF1 policy upload pipeline: HR uploads a valid PDF, the LangGraph Policy Agent processes it through all 5 nodes (PDF conversion, category extraction, condition extraction, DB save, embedding), and the new policy appears as Active in the Policy Library. | 1. HR navigates to Policy Studio. 2. Click "New Policy" and fill in metadata (name, department, version, effective date). 3. Upload a valid multi-page PDF reimbursement policy. 4. Observe the three-step processing overlay (Uploading → Analyzing → Saving). 5. Verify policy appears in library with status=Active. | Policy uploads successfully; all 5 LangGraph nodes complete; policy appears in library with correct metadata and status=Active; pgvector embeddings stored for RAG. | TestSprite TC006 + TC011 (frontend run, both PASSED): With valid PDF, WF1 pipeline completed successfully. Three-step overlay (Uploading → Analyzing → Saving) animated correctly; policy refreshed via getPolicies() and appeared with status=Active. Policy filter, search, edit metadata, and deletion lifecycle all verified. Backend confirmed POST /api/v1/policies |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | | | | | /upload returned HTTP 200 within 4–7 seconds. **Status: PASSED.** |
| TC-08 | **Integration — HR Claims Triage Dashboard: Bucket Switching, Search & Filter** | Verify the HR triage dashboard correctly loads claim data from the backend, allows switching between "Requires Attention" and "Passed AI Review" buckets, and supports search/filter operations to locate specific claims efficiently. | 1. HR logs in and navigates to /hr/dashboard. 2. Switch between "Requires Attention" and "Passed AI Review" tabs. 3. Use the search bar to filter by employee name. 4. Apply AI status filter chips. 5. Open the "View All Pending Requests" modal. | Tab switching correctly filters claims by AI judgment bucket. Search and filter reduce the displayed claim list dynamically. Modal shows full filtered claim list. API response latency is within acceptable range. | TestSprite TC009 (frontend run, PASSED): Tab switching between buckets updated displayed claims correctly. Search filtered by employee name, category, and status. Filter panel opened with AI status chips and amount range inputs. "View All Pending Requests" modal opened with full filtered list. GET /api/v1/reimbursements/ latency: 500–900 ms. **Status: PASSED.** |
| TC-09 | **Security — Session** | Verify that logging out correctly clears | 1. Log in as HR user. 2. | Post-logout navigation to | TestSprite TC008 |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | **Logout & Route Invalidation** | the JWT session from AuthContext/localStorage and that subsequent direct navigation to protected routes triggers a redirect to /login, confirming session invalidation works correctly. | Confirm access to /hr/dashboard. 3. Click the logout button. 4. After logout, attempt to directly navigate to /hr/dashboard and /employee/dashboard. | any protected route triggers redirect to /login. JWT is cleared from localStorage/AuthContext. No protected route content is rendered for the logged-out session. | (frontend run, PASSED): Logout correctly cleared JWT from localStorage/context. Subsequent navigation to /hr/dashboard triggered redirect to /login. No HR data was accessible post-logout. TC005 (PASSED): Direct navigation to /hr/dashboard without any session also correctly redirected to /login. **Status: PASSED.** |
| TC-10 | **UI Validation — Login Form Client-Side & Server-Side Validation** | Verify that the login form correctly enforces Zod + React Hook Form client-side validation (empty email blocks submission) and that the backend returns a 401 for invalid credentials with a visible inline error banner — no silent failures. | 1. Submit login form with an empty email field — observe inline validation error. 2. Submit login form with invalid.user@example.com / wrong-password — observe error banner | Empty email field submission is blocked client-side with inline Zod error. Invalid credentials trigger a backend 401 response surfaced as a visible authentication | TestSprite TC013 (PASSED): Empty email field triggered immediate Zod + React Hook Form validation error — "Enter a valid email address." No API call made. TC010 |

| Test Case ID | Test Type & Mapped Feature | Test Description | Test Steps | Expected Result | Actual Result |
|---|---|---|---|---|---|
| | | | and confirm no redirect occurs. | failure banner. User remains on /login. | (PASSED): Invalid credentials returned 401 in ~800 ms; inline authentication failure banner displayed correctly; user not redirected. **Status: PASSED (both validation paths).** |

Note: The tests listed above represent a curated subset of our critical path validation. The comprehensive suite of 30 automated test cases executed during this QA phase can be reviewed in the raw testsprite_results_frontend.md and testsprite_results_backend.md log files included in our repository.

## 6. AI Output & Boundary Testing (Drafts)

This section validates that our LangGraph integration produces deterministic, financially accurate outputs across our three primary agent workflows and handles edge cases — including oversized inputs, adversarial document manipulation, and LLM hallucination vectors — gracefully without producing incorrect compliance verdicts.

### 6.1. System Input/Output Test Pairs

These tests evaluate the core decision-making accuracy of the AI Agent across our primary workflows.

| Test ID | System Input / Trigger | Expected AI Output (Acceptance Criteria ) | Actual Output | Status |
|---|---|---|---|---|

| | | | | |
|---|---|---|---|---|
| AI-01 | **(WF2) Valid Upload:** Employee uploads a clear, standard meal receipt (JPEG/PNG) via POST /api/v1/documents/upload. Receipt shows: merchant = "Restoran ABC", date = 2026-04-20, total = RM 45.00, category = Meals. | JSON output must exactly match the visual receipt numbers and text with 0 hallucinated fields. Fields: merchant_name, date, amount, currency, category, confidence ≥ 0.7. No phantom line items or fabricated values. | Direct API test on localhost:8000: Document Agent (GLM-4.6 Vision path for JPEG) returned structured JSON with all fields extracted accurately. confidence=0.92. visual_anomalies_detected=False. No hallucinated fields detected. items_summary correctly captured food/beverage category. | Pass |
| AI-02 | **(WF3) Compliance Trigger:** System feeds a meal receipt extraction of RM 50.00 into the policy compliance logic where the active policy defines a RM 40.00 meal cap for the employee's rank. | AI Agent correctly identifies the RM 10.00 overage, assigns status=PARTIAL_APPROVE to the per-receipt line item, sets approved_amount=40.00, deduction_amount=10.00, and flags the specific policy condition that was violated in the audit_notes field. | TestSprite TC002 (frontend run, PASSED) + TC014 (both runs, PASSED): HR review page at /hr/review/[id] rendered per-receipt line items with PARTIAL_APPROVE status, approved vs. requested amounts, and policy-grounded audit notes. Amount editing and HR note submission via PATCH confirmed correct. Backend | Pass |

| | | | | |
|---|---|---|---|---|
| | | | judgment field correctly reflected policy violation. | |
| AI-03 | **Fraud Trap Trigger:** Employee manually edits the input field to "RM 300.00" but the OCR extraction payload from GLM-4.6 Vision shows "RM 30.00" (10× discrepancy). | System detects the mathematical discrepancy and explicitly routes the claim to Bucket B (judgment=MANUAL REVIEW). human_edited=True, overall_risk=HIGH. change_summary.changes_by_field.amount records original=30.00, edited=300.00. | Direct API test on localhost:8000 (POST /api/v1/documents/{id}/edits with inflated amount): change_detector.py correctly set human_edited=True and overall_risk=HIGH. change_summary JSONB recorded exact original vs. edited values. Compliance Agent's final_judgment node produced MANUAL REVIEW routing to Bucket B. HR audit trail displayed the discrepancy flag with severity badge. | Pass |

### 6.2. Oversized/Larger Input Test

Because Reclaim processes visual receipt data and PDF policy documents through external LLM APIs (Qwen3.5-Flash-02-23 via OpenRouter, GLM-5.1 via ILMU), we must strictly define payload limits to prevent LangGraph timeouts, control API token costs, and ensure system stability under large file submissions.

| Fields | Details |
|---|---|
| Maximum Input Size | Policy PDF: Max 10 MB. Receipt Image: Max 10 receipts (2 MB each). Policy markdown capped at 80,000 characters before LLM ingestion; PDF text chunked to 8,000 characters per LLM call (per SAD Section 2.1.2). |
| Input used while testing | Backend TestSprite session: Policy upload with a .txt file fixture (wrong type, < 1 KB) successfully triggered file type validation gate. Note: A > 5 MB oversized PDF fixture was not submitted in either TestSprite session due to dev-mode 15-test execution cap. Frontend Policy Studio UI states "Supports PDF, DOCX, TXT • Max 10 MB" — broader than backend PDF-only enforcement. |
| Expected Behavior | Frontend strictly rejects the upload before it hits the backend AI Agent for type violations; backend enforces a size limit and returns a 413 or equivalent user-visible error for files exceeding 10 MB. No LangGraph node is invoked for rejected uploads. |
| Actual Behavior | File type validation confirmed operational: backend rejected .txt file in < 200 ms with clear error message "Only PDF files are accepted. Got: policy.txt". Oversized file (> 5 MB) rejection behavior not directly tested — no > 5 MB fixture submitted in either TestSprite session. Frontend accept attribute is broader than backend allows, creating a UX gap (user can select .docx but will get a backend rejection with no prior client-side warning). |
| Status | Partial Pass (type validation confirmed; size limit validation not tested — flagged as COV-003 in defect log) |

### 6.3. Adversarial/Edge Input Test

We tested the system's resilience against malformed document uploads and data manipulation.

- **Adversarial Input:** Employee uploads a receipt where the total amount is partially obscured or unreadable by the Vision LLM, and then manually types a highly inflated amount (e.g., RM 500.00) into the frontend verification form.
- **Expected Handling:** The LangChain/GLM-4.6 Vision OCR will return a low-confidence extraction or a null value for the total field, setting visual_anomalies_detected=True. The Fraud Trap logic will immediately catch the mismatch between the employee's high typed input and the missing/uncertain OCR data, triggering human_edited=True and

overall_risk=HIGH. The claim is routed directly to Bucket B (MANUAL REVIEW) because the fallback logic requires a confident OCR match to proceed without escalation — the AI cannot be "tricked" into approving a claim where the source data is unverifiable.

- **Actual Result:** Direct API-level test on localhost:8000: submitting a low-quality (blurred) receipt image returned confidence=0.41 and visual_anomalies_detected=True from the Document Agent. When the employee's edit submitted amount=RM 500.00 against the extracted amount=null, change_detector.py set overall_risk=HIGH and human_edited=True. The Compliance Agent's final_judgment node correctly routed the claim to MANUAL REVIEW (Bucket B). The system did not produce an APPROVE judgment. **Status: PASSED — Adversarial input correctly escalated to mandatory HR review.**

### 6.4. Hallucinating Handling

Because Reclaim handles sensitive financial data where LLM hallucinations could directly cause incorrect claim approvals or unjustified rejections, we implement **"Deterministic Guardrails"** to structurally prevent LLM hallucinations from bypassing the financial audit loop. Rather than asking the LLM to simply output "Approved" or "Rejected," the AI is strictly used for two bounded tasks: (1) **data extraction** — the Document Agent extracts structured fields (Dates, Amounts, Merchant Name) from visual inputs into a typed JSON schema enforced by response_format: json_object; and (2) **policy querying** — the Compliance Agent evaluates extracted data against explicitly stated mandatory conditions retrieved from the database. The final routing decision (Bucket A vs. Bucket B) is executed by deterministic Python logic in the aggregate_totals node (no LLM call) and confirmed by the final_judgment ReAct agent which is hard-capped at 3 tool iterations — if the LLM has not reached a confident verdict by the cap, the system defaults to MANUAL REVIEW, ensuring that LLM uncertainty always escalates to human oversight rather than defaulting to approval. This hybrid architecture guarantees that hallucinated amounts or fabricated policy clauses in the LLM's reasoning chain cannot bypass the structured financial audit loop, because the final financial calculation is performed in pure Python against database-persisted values.

**A Note on Agile QA Methodology**

In accordance with Agile development principles, the Quality Assurance strategies defined in this document were not treated as a rigid, final-hour phase. Testing — particularly the AI boundary constraints and localized component checks — was conducted iteratively throughout the Reclaim MVP development cycle (2026-04-16 to 2026-04-25) to ensure continuous integration stability prior to this final Code Freeze. Two TestSprite sessions were run: a backend-focused session on 2026-04-25 and a frontend-comprehensive session on 2026-04-26, each representing a snapshot of the MVP's QA state at that point in the sprint timeline.
